SIMATS ENGINEERING (SAVEETHA SCHOOL OF ENGINEERING)

Department of Artificial Intelligence and Data Science

CO1-ASSESSMENT TOOL 1 – APPLICATION BASED QUESTIONS

Course Code:	**DSA03**	**Course Title:**	**Natural Language Processing**
CO Assessed:	**CO1 – Imitation (L1)**	**Assessment:**	**Assessment Tool 1 – Application Based Questions**
Weightage:	**40% of CIA**		
CO1 Statement:	**Analyse NLP models, regular expression patterns, finite state automata, morphological processing techniques and to interpret language processing. (BL-3)**		
Student Name:	**A. Abhishek Reddy**	**Reg. No.:**	**192424192**
Section / Batch:	**AI&DS**	**Date:**	**10/10/26**

Code of Conduct

I* A. Abhishek Reddy *(*192424192*) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: A. Abhishek Reddy

Instructions

- **Develop a modular and efficient Python program that satisfies all the functional requirements specified in the problem statement.**
- **Demonstrate the correctness of the implementation using suitable test cases and justify the output obtained.**

- **Follow good programming practices, including meaningful variable names, proper code indentation, comments, and error handling wherever applicable.**
- **Duration: 30 minutes.**

Section / Topic	Focus	Q Nos
Information Extraction	Regex-Based Information Extraction	1
Pattern Matching	Regex Pattern Matching	2
Regular Expression Patterns	Regex-Based Input Validation	3

Annexure A – Application Based Questions

Section 1: Regular Expressions – Resume Information Extraction

1. **A multinational recruitment company receives thousands of resumes every day in text format. The HR department requires an automated system to extract candidate information for shortlisting.**

Design and implement a Python-based resume information extraction system using Regular Expressions that performs the following tasks:

Extract the candidate's name.

Identify email addresses.

Extract mobile numbers.

Detect technical skills (Python, Java, SQL, Machine Learning, NLP).

Extract years of experience.

Generate a structured summary of the candidate's profile.

Display candidates who satisfy the minimum eligibility criteria (minimum 2 years of experience and Python skill).

Section 2: Regular Expressions – Product Search System

2. An e-commerce company plans to enhance its product search engine to improve customer experience through flexible keyword matching.

Design and implement a Python-based product search system using Regular Expressions that performs the following tasks:

Search products using an exact keyword.

Perform prefix-based searches.

Perform suffix-based searches.

Search using partial keywords.

Perform case-insensitive searches.

Display all matching product names.

Generate a report showing the total number of matching products for each search.

Section 3: Regular Expressions – University Registration System

A university is developing an automated online registration portal to verify student information before course enrollment.

Design and implement a Python-based validation system using Regular Expressions that performs the following tasks:

Validate the student register number.

Validate the institutional email address.

Validate the course code.

Validate the semester information.

Validate the student's mobile number.

Display appropriate validation messages for each field.

Generate a final registration status report indicating whether the registration is successful.

Rubrics for Calculation

Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Understanding of Problem Context	20	Clearly understands the problem and accurately identifies all requirements	Good understanding with minor gaps	Basic understanding; some requirements unclear	Poor understanding or misinterpretation of the problem
Application of Concepts	30	Accurately applies appropriate concepts to solve complex problems	Applies relevant concepts correctly with minor errors	Applies basic concepts with limited accuracy	Fails to apply appropriate concepts
Problem-Solving Approach	20	Logical, well-structured, and efficient approach	Mostly logical approach with minor gaps	Basic approach with some inconsistencies	Illogical or unclear approach
Accuracy of Solution	20	Completely correct solution with proper justification	Mostly correct with minor errors	Partially correct solution	Incorrect or incomplete solution
Clarity	10	Clear, well-organized, and properly explained solution	Understandable with minor clarity issues	Limited clarity and explanation	Poorly presented and difficult to understand

Q. No. / Criteria	Understanding of Problem Context	Application of Concepts	Problem-Solving Approach	Accuracy of Solution	Clarity	Sub. Total	Total %
1							
2

Section 1: Regular Expressions – Resume Information Extraction

1. A multinational recruitment company receives thousands of resumes every day in text format. The HR department requires an automated system to extract candidate information for shortlisting.

Design and implement a Python-based resume information extraction system using Regular Expressions that performs the following tasks:

Extract the candidate's name.

Identify email addresses.

Extract mobile numbers.

Detect technical skills (Python, Java, SQL, Machine Learning, NLP).

Extract years of experience.

Generate a structured summary of the candidate's profile.

Display candidates who satisfy the minimum eligibility criteria (minimum 2 years of experience and Python skill).

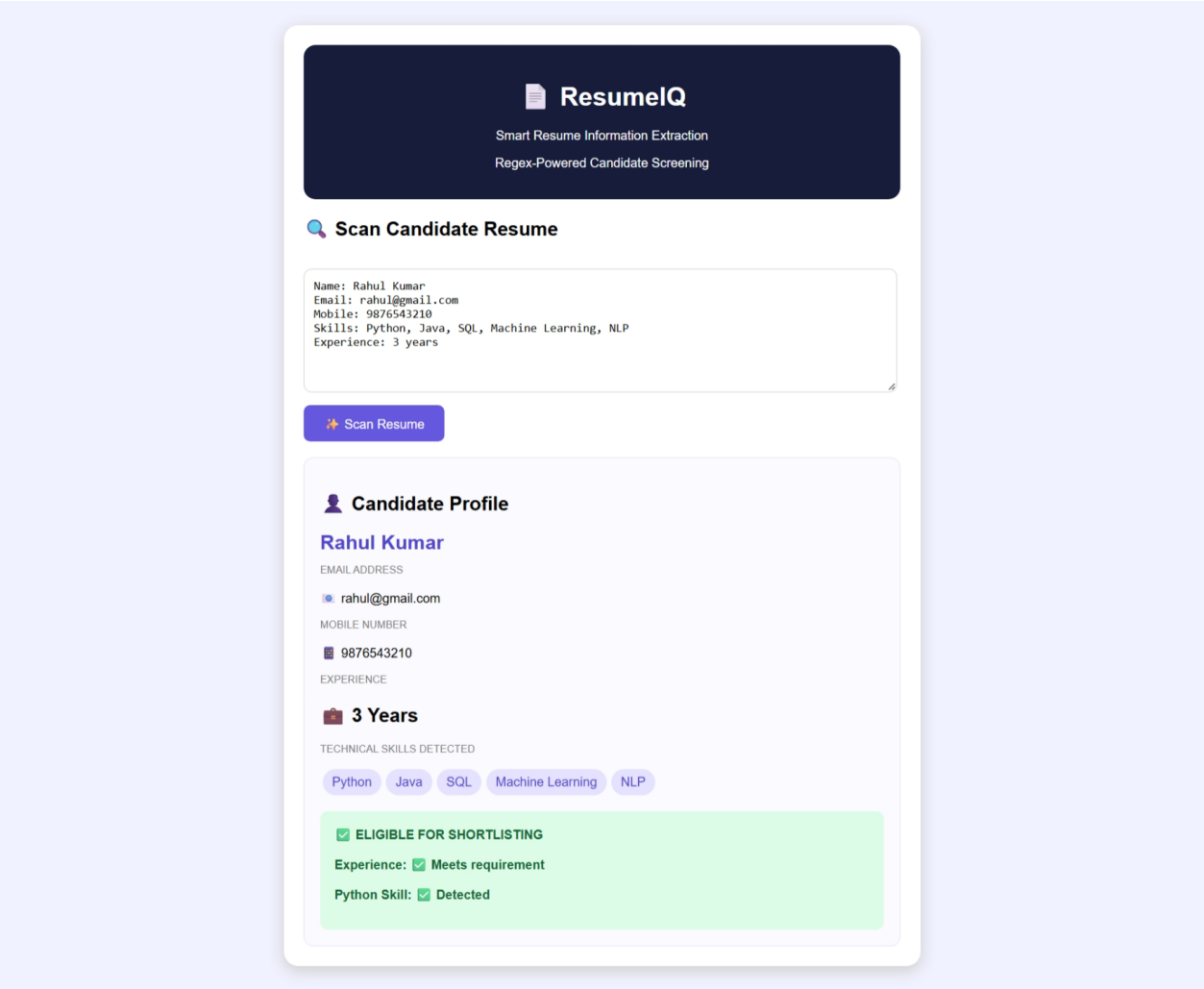

1.A. Aim: To develop a Python program to extract candidate information from resumes and identify eligible candidates.

Code:

```
import re
resumes = [
    """Name: Rahul Kumar
    Email: rahul@gmail.com
    Mobile: 9876543210
    Skills: Python, Java, SQL, NLP
    Experience: 3 years""",
    """Name: Priya Sharma
    Email: priya@gmail.com
    Mobile: 9876543211
    Skills: Java, SQL
    Experience: 1 year"""
]
for resume in resumes:
    name = re.search(r"Name:\s*(.*)", resume)
    email = re.search(r"[\w.-]+@[\w.-]+\.\w+", resume)
    mobile = re.search(r"\b[6-9]\d{9}\b", resume)
    experience = re.search(r"Experience:\s*(\d+)", resume)
    skills = re.findall(
        r"Python|Java|SQL|Machine Learning|NLP",
        resume,
        re.IGNORECASE
    )
    print("\nCandidate Profile")
    print("Name:", name.group(1) if name else "Not found")
    print("Email:", email.group() if email else "Not found")
    print("Mobile:", mobile.group() if mobile else "Not found")
    print("Skills:", ", ".join(skills) if skills else "None")
    years = int(experience.group(1)) if experience else 0
    print("Experience:", years, "years")
```

```
    if years >= 2 and any(s.lower() == "python" for s in skills):
        print("Eligibility: Eligible")
    else:
        print("Eligibility: Not Eligible")
```

Output:

Result: Candidate details were extracted using regular expressions, and candidates with at least two years of experience and Python skills were identified.

Section 2: Regular Expressions – Product Search System

1. An e-commerce company plans to enhance its product search engine to improve customer experience through flexible keyword matching.

Design and implement a Python-based product search system using Regular Expressions that performs the following tasks:

Search products using an exact keyword.

Perform prefix-based searches.

Perform suffix-based searches.

Search using partial keywords.

Perform case-insensitive searches.

Display all matching product names.

Generate a report showing the total number of matching products for each search.

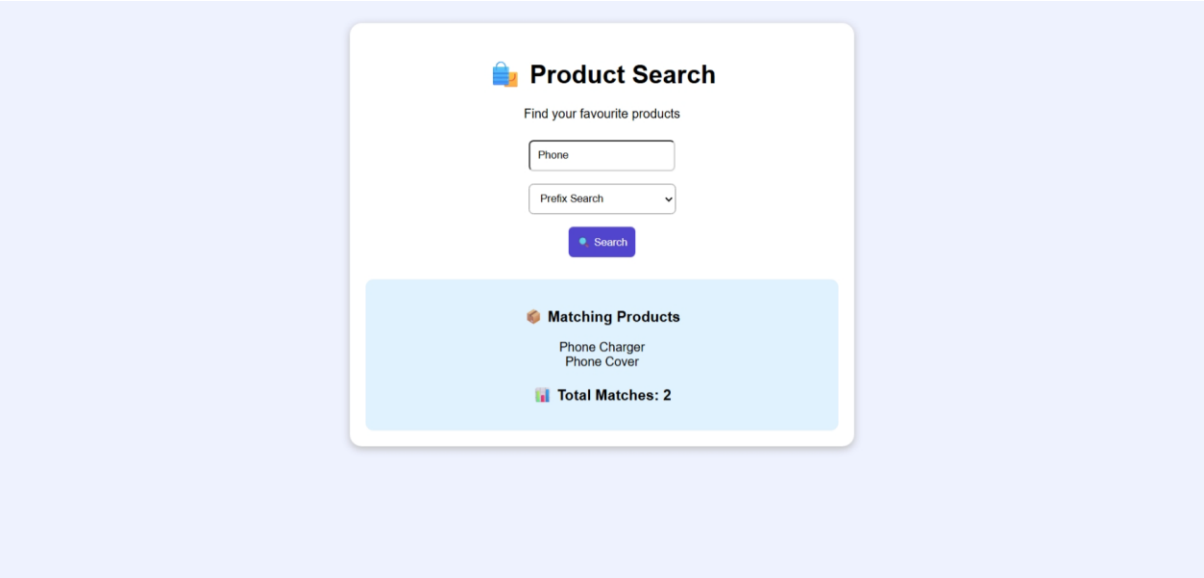

2.A. Aim: To develop a Python program that searches product names using exact, prefix, suffix, partial, and case-insensitive keyword matching.

Code:

```
import re
products = [
    "Apple Laptop",
    "Samsung Mobile",
    "Apple iPhone",
    "HP Laptop",
    "Dell Computer",
    "Samsung Tablet"
]
def search_products(keyword, mode):
    if mode == "exact":
        pattern = r"^" + re.escape(keyword) + r"$"
    elif mode == "prefix":
        pattern = r"^" + re.escape(keyword)
    elif mode == "suffix":
        pattern = re.escape(keyword) + r"$"
    else:
        pattern = re.escape(keyword)
    matches = [
        product for product in products
        if re.search(pattern, product, re.IGNORECASE)
    ]
```

```
    print("\nSearch Type:", mode)
    print("Keyword:", keyword)
    print("Matching Products:", matches)
    print("Total Matches:", len(matches))
search_products("Apple Laptop", "exact")
search_products("Samsung", "prefix")
search_products("Laptop", "suffix")
search_products("Computer", "partial")
search_products("apple", "partial")
```

Output:

Result: The product search system successfully performed different types of keyword searches and displayed the matching products and their total count.

Section 3: Regular Expressions – University Registration System

A university is developing an automated online registration portal to verify student information before course enrollment.

Design and implement a Python-based validation system using Regular Expressions that performs the following tasks:

Validate the student register number.

Validate the institutional email address.

Validate the course code.

Validate the semester information.

Validate the student's mobile number.

Display appropriate validation messages for each field.

Generate a final registration status report indicating whether the registration is successful.

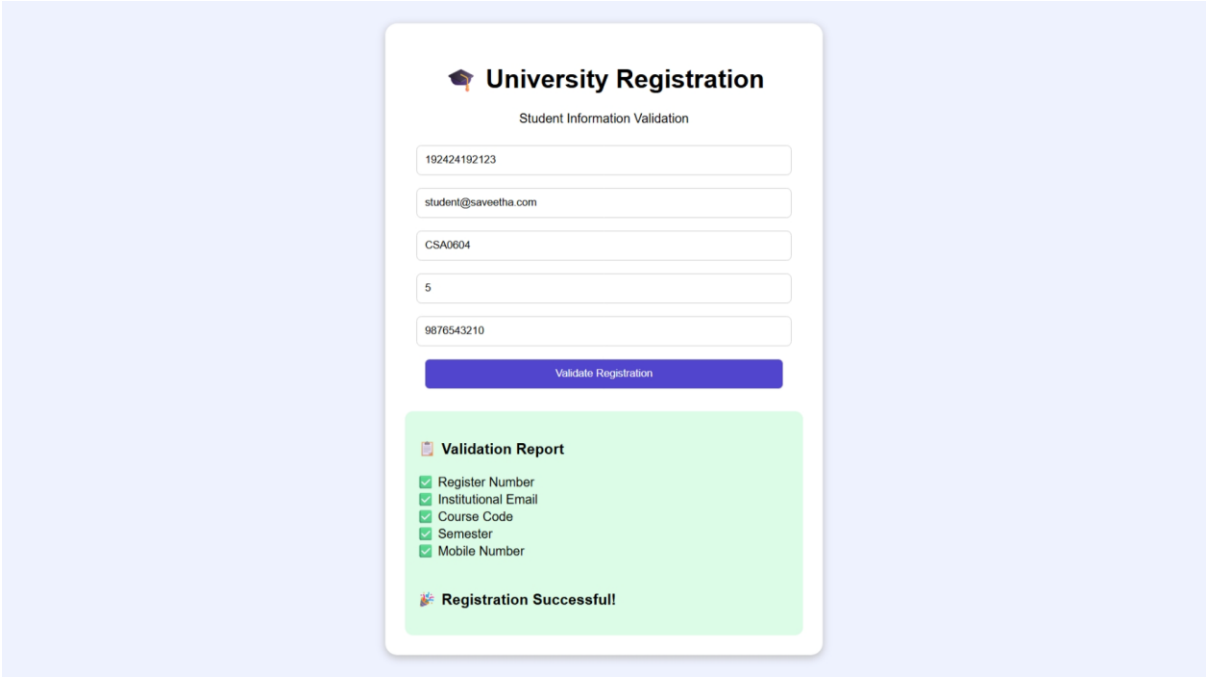

3.A. Aim: To develop a Python program that validates a student's register number, institutional email, course code, semester, and mobile number.

Code:

```
import re
register_no = input("Enter Register Number: ")
email = input("Enter Institutional Email: ")
course = input("Enter Course Code: ")
semester = input("Enter Semester: ")
mobile = input("Enter Mobile Number: ")
valid1 = re.fullmatch(r"\d{12}", register_no)
valid2 = re.fullmatch(
    r"[\w.-]+@[\w.-]+\.\w+", email
)
valid3 = re.fullmatch(
    r"[A-Z]{2,4}\d{2,4}", course
)
valid4 = re.fullmatch(
    r"(Semester )?[1-8]", semester
)
valid5 = re.fullmatch(
    r"[6-9]\d{9}", mobile
)
print("\n--- Validation Report ---")
print("Register Number:",
      "Valid" if valid1 else "Invalid")
print("Email:",
      "Valid" if valid2 else "Invalid")
```

```
print("Course Code:",
      "Valid" if valid3 else "Invalid")
print("Semester:",
      "Valid" if valid4 else "Invalid")
print("Mobile Number:",
      "Valid" if valid5 else "Invalid")
if all([valid1, valid2, valid3, valid4, valid5]):
    print("Registration Status: Successful")
else:
    print("Registration Status: Failed")
```

Output:

Result: The registration system successfully validated all five fields using regular expressions and generated the final registration status.
